

### Mounting onto acrylic and aluminum sheet

This is another application also popular nowadays. It's based on face mounting a print onto an acrylic sheet and adding an aluminum sheet to the back for extra projection. Thick brackets are used to create a floating illusion when the finished artwork is on display.

Please refer to the “Mounting artwork on aluminum sheets” and “Face mounting on acrylic sheet” PDFs for a detailed list of material and step-by-step instructions.

Notice, however, that the mounting process between the acrylic sheet with the face mounted image and the aluminum sheet with the adhesive is not done with a roller laminator. Both surfaces are rigid and the mounting process is done manually instead.

With that in mind:

- Start by mounting the print onto the acrylic sheet
- Then mount the artwork onto the aluminum sheet
- Finish by adding the brackets
